DR. SEBASTIAN PALMQVIST | MD PHD
Senior Consultant Neurologist, Skåne University Hospital, and
Associate Professor, Lund University, Sweden
GM-54571. March 2025.

THE EVOLVING JOURNEY OF ALZHEIMER'S DISEASE BLOOD BIOMARKERS IN CLINICAL PRACTICE

Lilly

Personal Disclosures

Dr. Sebastian Palmqvist acquired research support (for the institution) from Avid Technology and ki:elements/ Alzheimer's Drug Discovery Foundation.

In the past 2 years, Dr. Sebastian Palmqvist received consultancy/speaker fees from BioArctic, Biogen, Eisai, Lilly, and Roche.

Dr. Sebastian Palmqvist received no financial compensation from C_2N Diagnostics (neither privately nor to the institution).

Dr. Sebastian Palmqvist owns no stocks and has no financial interest in C_2N Diagnostics.

Acceptable Performance of AD Blood Biomarkers Recommendations from the Global CEO Initiative[1]

Required performance of the biomarker is dependent on setting and intended use:

For triaging before confirmatory testing (CSF/PET): **≥90% sensitivity and ≥75-85% specificity** (depending on availability of confirmatory testing)

For confirmatory testing of AD pathology: **≈90% sensitivity and specificity** (equivalent to CSF)

Important to consider the assumed prevalence of AD positivity (i.e., pre-test probability)

Minimum acceptable performance of blood biomarker tests for triaging or confirmation of amyloid pathology[1]

Test	Minimum acceptable performance	Predictive value according to prevalence of amyloid pathology	
		Prevalence of amyloid pathology	Predictive value
Confirmatory test	90% sensitivity 90% specificity	80%	PPV 97% NPV 69%
		50%	PPV 90% NPV 90%
		20%	PPV 69% NPV 97%
High-specificity triaging test	90% sensitivity 85% specificity	80%	PPV 96% NPV 68%
		50%	PPV 86% NPV 89%
		20%	PPV 60% NPV 97%
Low-specificity triaging test	90% sensitivity 75% specificity	80%	PPV 94% NPV 65%
		50%	PPV 78% NPV 88%
		20%	PPV 47% NPV 97%

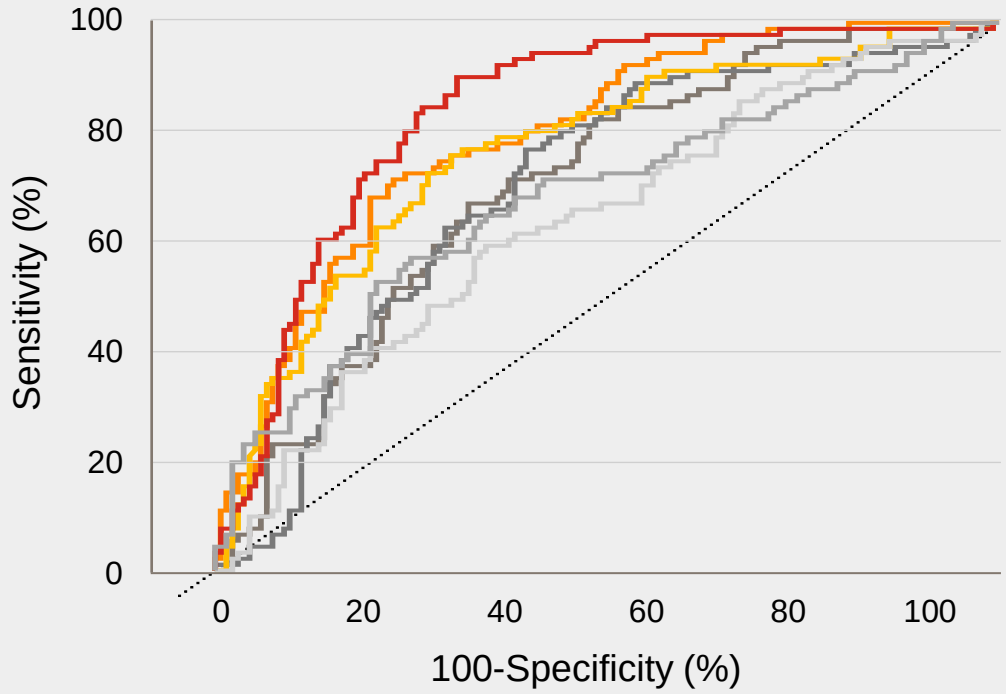
Plasma Biomarkers of Amyloid-Beta (Aβ) Pathology

The Aβ42/40 ratio

Comparison of Key Plasma Aβ42/Aβ40 Assays

ROC curve analysis for differentiating participants with abnormal and normal CSF Aβ42/40[1,*]



Plasma Aβ42/40 assays

- IP-MS-WashU: AUC, 0.84
- IA-Elc: AUC, 0.80
- LC-MS-Arc: AUC, 0.76
- IA-N4PE: AUC, 0.71
- IA-EI: AUC, 0.70
- IP-MS-UGOT: AUC, 0.68
- IA-Quan: AUC, 0.64

IP-MS-WashU had the highest discriminative accuracy.[1]

Findings may inform future clinical use of blood tests for Aβ pathology in AD.[1]

Modified from: Janelidze S, et al. *JAMA Neurol.* 2021[1]

*Analysis in the subcohorts where IPMS-UGOT and IA-Quan Aβ42/40 were available (n=227). The cutoff for abnormal CSF Aβ42/40 was 0.0597.
Aβ=Amyloid-Beta; AD=Alzheimer's Disease; AUC=Area Under the Curve; CSF=Cerebrospinal Fluid; IA-EI=Immunoassay from Euroimmun; IA-Elc=Elecsys Immunoassay from Roche Diagnostics; IA-N4PE=Neurology 4-Plex E Simoa Immunoassay from Quanterix; IA-Quan=Immunoassay from Quanterix; IP-MS-UGOT=Immunoprecipitation-Mass Spectrometry–based Method from the University of Gothenburg; IP-MS-WashU=Immunoprecipitation-Coupled Mass Spectrometry Method from Washington University; LC-MS-Arc=Antibody-Free Liquid Chromatography-Mass Spectrometry Method from Araclon; ROC=Receiver Operating Characteristic.

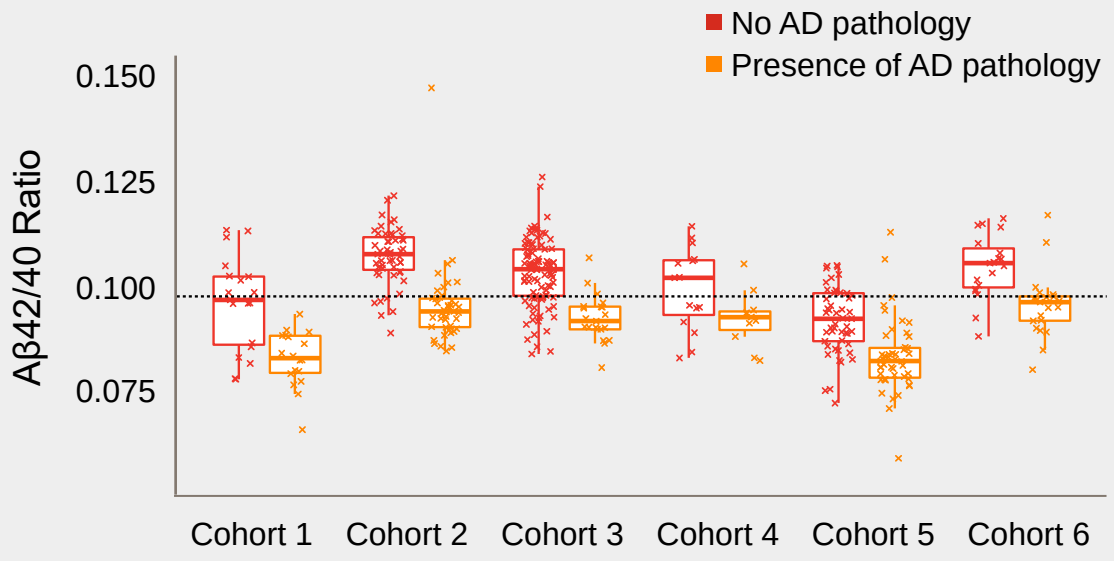
Levels of Plasma Aβ42/40 Ratio in Alzheimer's Disease

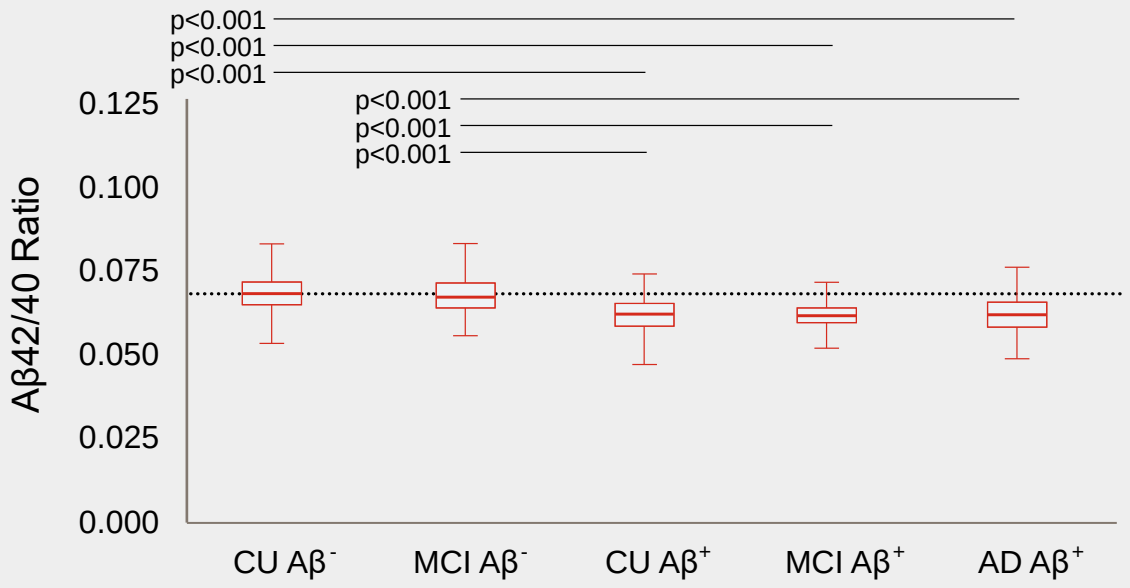
- Similar to other plasma Aβ studies, plasma Aβ42/40 showed a decrease of only ~10-20% in AD (compared to ~40-60% in CSF).[1-3]
- This may affect accuracy using a single cutoff over time and in different populations.[2,3]

Scatter-Box-Whisker plot of plasma Aβ42/40 for brain amyloid negative or positive status[4,*]



Modified from: West T, et al. *Mol Neurodegener.* 2021[4]

Boxplot of plasma Aβ42/40 stratified by CU, MCI, and AD Aβ status[1]



Modified from: Palmqvist S, et al. *JAMA Neurol.* 2019[1]

*Banked plasma samples were collected from six independent cohorts (N=37, 94, 121, 26, 96, 40 for Cohorts 1-6, respectively). Plasma $A\beta_{42/40}$ ratios are separated by brain amyloid status.
Aβ=Amyloid-Beta; AD=Alzheimer's Disease; CSF=Cerebrospinal Fluid; CU=Cognitively Unimpaired; MCI=Mild Cognitive Impairment.

Blood-Based Biomarkers in AD: What Needs to Be Done Before Clinical Implementation?

The Alzheimer's Association appropriate use recommendations for BBMs in AD:[1]

- **To determine** "clinical robustness in a real-world setting in prospective studies where
  (1) pre-defined cutoffs are used
  (2) samples are analyzed continuously over the study period"

- **To perform** "prospective studies in primary care settings, including representative and diverse populations with cognitive symptoms"

- **To evaluate** "BBMs in diverse (real-life) memory clinic populations prospectively using predefined cutoffs"

Perform the above using high-quality reference standard (CSF or PET)

AD=Alzheimer's Disease; BBM=Blood-Based Biomarker; CSF=Cerebrospinal Fluid; PET=Positron Emission Tomography.

1. Hansson O, et al. The Alzheimer's Association Appropriate Use Recommendations for Blood Biomarkers in Alzheimer's Disease. *Alzheimers Dement.* 2022;18(12):2669-2686.

Case – Blood-Based Biomarkers

80-year-old woman

Newly widowed, living alone, sees son bi-weekly

Cognitive symptoms (started 2-3 years ago):

- reduced initiative
- poorer memory
- trouble finding the right words
- increased anxiety, easily stressed

This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.

Case - Work-up in Primary Care

MMSE 28/30 points

Routine blood tests did not find **any secondary causes**

CT scan

- Moderate to severe white matter lesions (Fazekas 2-3)
- Moderate hippocampal atrophy (MTA score 2)

Assessment by PCP

- **Cognitive stage:** SCD (or possibly MCI)
- **Etiology:** Vascular pathology (8 out of 10 in certainty)

Plan

- Initiate cardiovascular treatment
- Follow-up in primary care

CT scan

CT=Computed Tomography; MCI=Mild Cognitive Impairment; MMSE=Mini-Mental State Examination; MTA=Medial Temporal Lobe Atrophy Score; PCP=Primary Care Physician; SCD=Subjective Cognitive Decline.
This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.
Image provided by the speaker.

Case – Further Investigation at Our Memory Clinic

PrecivityAD2 test	**Positive**
APS2	**98**/100 (<18 negative, 18-37 intermediate)
%P-tau217	**4.52** (reference <2.4)
Aβ42/40	**0.096** (reference <0.089)
P-tau217 (Lumipulse)	**0.56** pg/mL (reference <0.27 pg/mL)* – not shown to the PCP

Re-evaluation by PCP

Cognitive stage
SCD (or possibly MCI)

Etiology
AD (9 out of 10 in certainty)

Plan

Initiate cardiovascular treatment

Refer to our memory clinic

*Locally determined cutoffs; cutoffs may vary from one laboratory to another.
Aβ=Amyloid-Beta; AD=Alzheimer's Disease; APS2=Amyloid Probability Score 2; MCI=Mild Cognitive Impairment; P-tau=Phosphorylated tau; PCP=Primary Care Physician; SCD=Subjective Cognitive Decline.
This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.

Case – Further Investigation at Our Memory Clinic

In-depth ADL interview

Lack of initiative → not shopping for groceries in time → no food at home → son now responsible for grocery shopping

Procrastinates in addressing invoices and administrative tasks → son taking over these responsibilities

Additional cognitive testing

ADAS cog 10-word delayed recall: **2**/10 correct

RBANS 10-word delayed recall: **0**/10 correct

TMT A: **50** sec (normal for age)

TMT B: **Cannot complete**

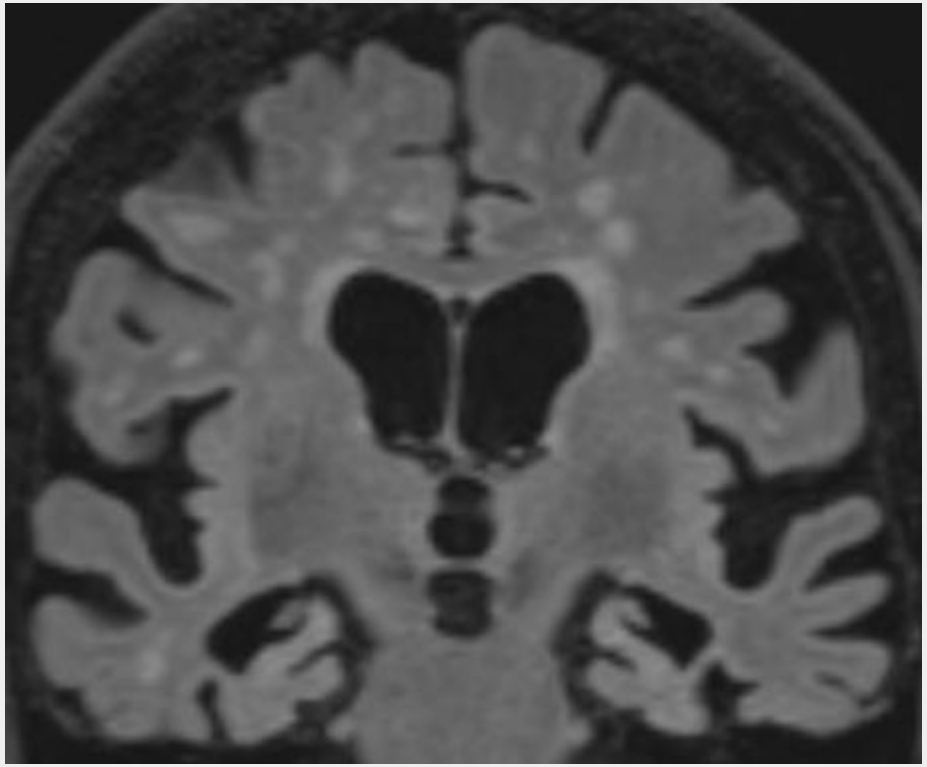
BNT-15: **6**/15 correct namings (abnormal)

ADAS=Alzheimer's Disease Assessment Scale; ADL=Activities of Daily Living; BNT-15=Boston Naming Test 15; RBANS=Repeatable Battery for the Assessment of Neuropsychological Status; TMT=Trail Making Test.

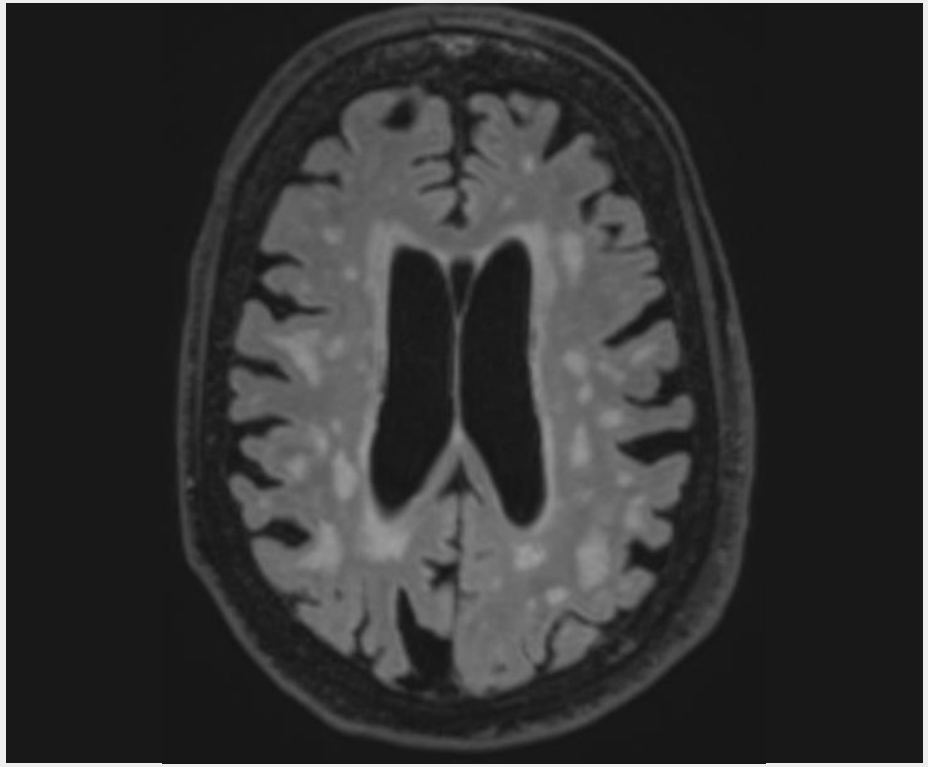
This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.

Case – MRI

MRI frontal view



MRI transversal view



MRI=Magnetic Resonance Imaging.
This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.
Images provided by the speaker.

Case – CSF analysis (Fujirebio)

CSF Aβ42/40	**0.052** (reference <0.072)
CSF P-tau	**85 ng/L** (reference <50)*
CSF Aβ42/P-tau181	**6.4** (reference >15)*

Assessment by me

Cognitive stage: mild dementia (yes, despite an MMSE of 28)

Etiology: AD and vascular pathology (both are likely causing symptoms)

Plan

Initiated ChEI and shortly after that memantine

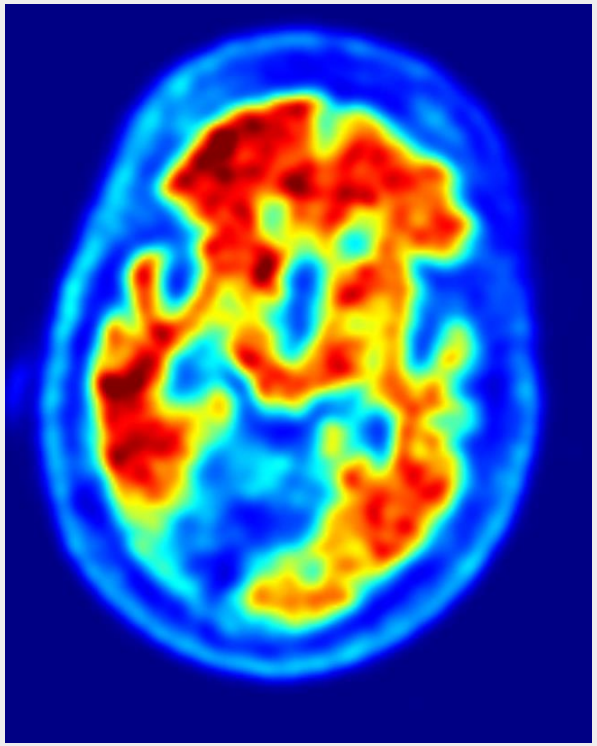
Initiated contacts with home care services and a nurse that delivered medication (was not taken correct)

6 months later
MMSE 24/30

*Locally determined cutoffs; cutoffs may vary from one laboratory to another.
Aβ=Amyloid-Beta; AD=Alzheimer's Disease; ChEI=Cholinesterase Inhibitors; CSF=Cerebrospinal Fluid; MMSE=Mini-Mental State Examination; P-Tau=Phosphorylated tau.
This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.

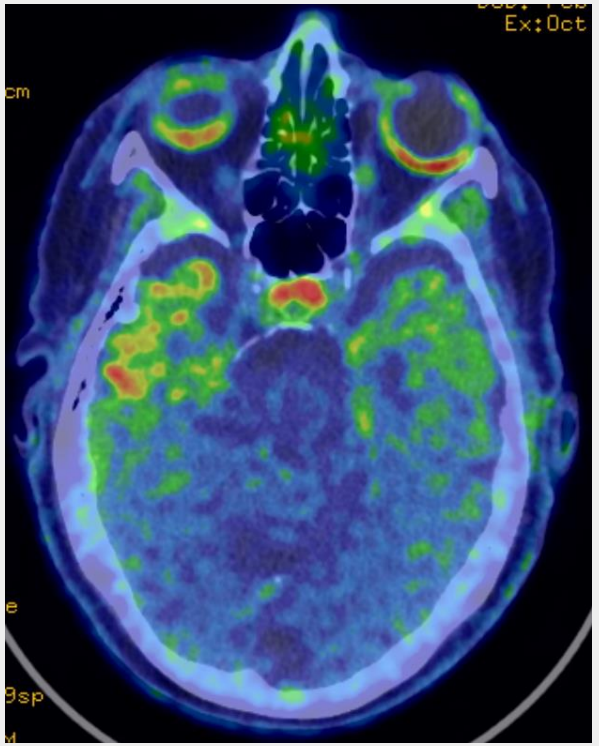
Case – Biomarker PET

Amyloid PET: positive



Radioligand: 18F-flutemetamol

Tau PET: increased uptake in the temporal lobes



Radioligand: 18F-RO948

PET=Positron Emission Tomography.

This case presentation discusses Dr. Sebastian Palmqvist's professional experience. Individual results might vary, and the experience discussed may not reflect the results seen in all patients.

Images provided by the speaker.

Takeaways

- BBMs (especially plasma P-tau217) are accurate for detecting AD pathology in individuals with cognitive symptoms.[1-3]
- Accuracy differs depending on the assay (many are now planned to be used in clinical practice).[1]
- Positive for AD pathology ≠ AD pathology causing the symptoms (clinical evaluation needed).[3,4]
- BBMs have the potential to aid in the diagnosis and selection of patients for referral.[2,3]
- Guidelines are needed (especially for use in primary care).[2,5,6]

AD=Alzheimer's Disease; BBM=Blood-Based Biomarker; P-tau=Phosphorylated tau.
